

DROUGHT MANAGEMENT: DESIGNING RULES FOR CONJUNCTIVE USE UNDER DROUGHT. THE ROLE OF GROUNDWATER SOURCES

Laura Tanco Ballesteros
Hydrological Planning Office
Júcar River Basin Authority

The Jucar River Basin District context

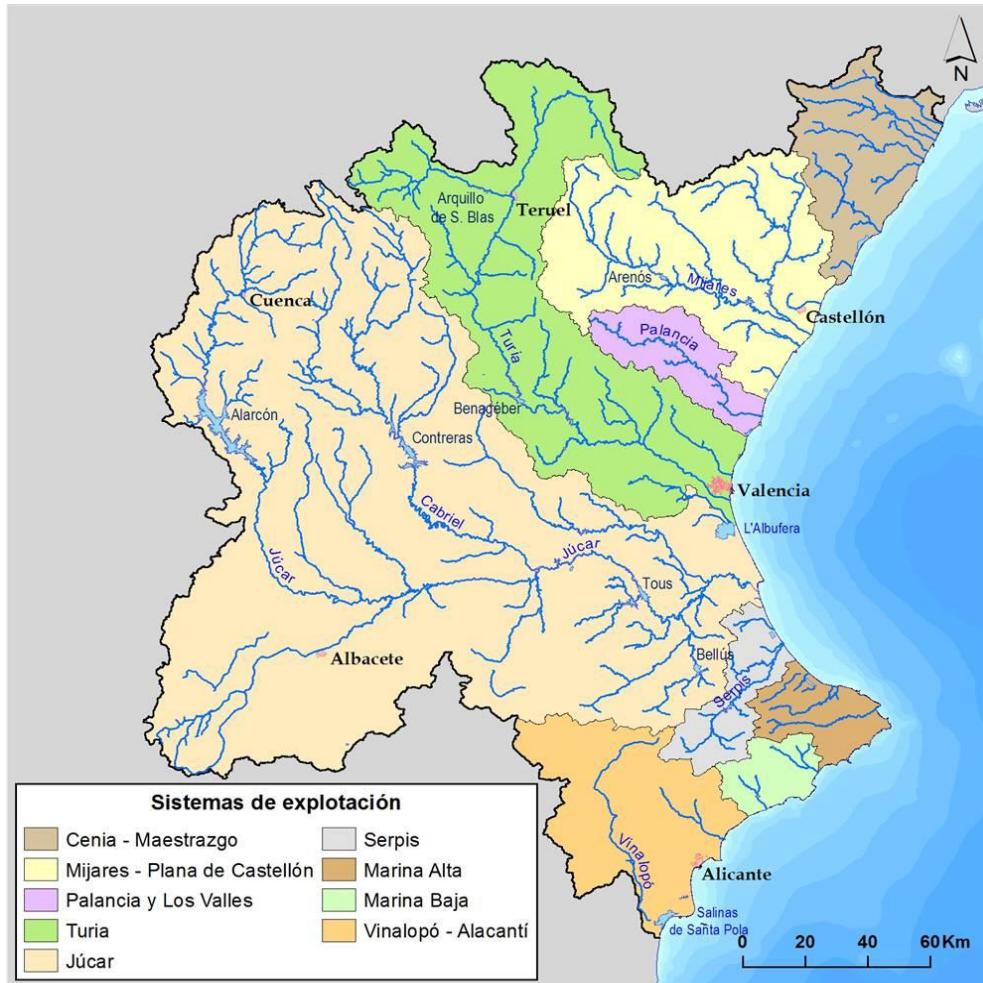

Where we are...

Footnotes:

- 1) Map based largely on submissions of digital River Basin Districts (RBDs) from EU Member States and Norway.
 - 2) Some of the international RBDs shown on this map were identified as being international by the Member States, i.e. the Adour-Garonne, Rhone and Seine in France, the Vistula in Poland, the Kengsjo and Vuoksi in Russia, the German Elbe and Saxon/Traue RBDs are shared with the Danish international RBD. Part of the Italian Eastern Alps RBD is shared with the Slovenian Adriatic RBD.
 - 3) It is understood that the Tonle Sap/Rak Chor RBD in Cambodia is shared with Thailand, most likely as part of the Mekong River basin. As the Bothnian Bay covers several river catchments, the Tornionjoki and Bothnian Bay have been kept separate in this map.
 - 4) Coastal waters are defined in the Water Framework Directive (WFD) as extending 1 nautical mile from the coastline. However, some Member States have included a larger part of their coastal waters within the RBD boundaries.
- The delineation of the Fennoscandian RBD between Norway and Finland is currently under review.

Description of the JRBD

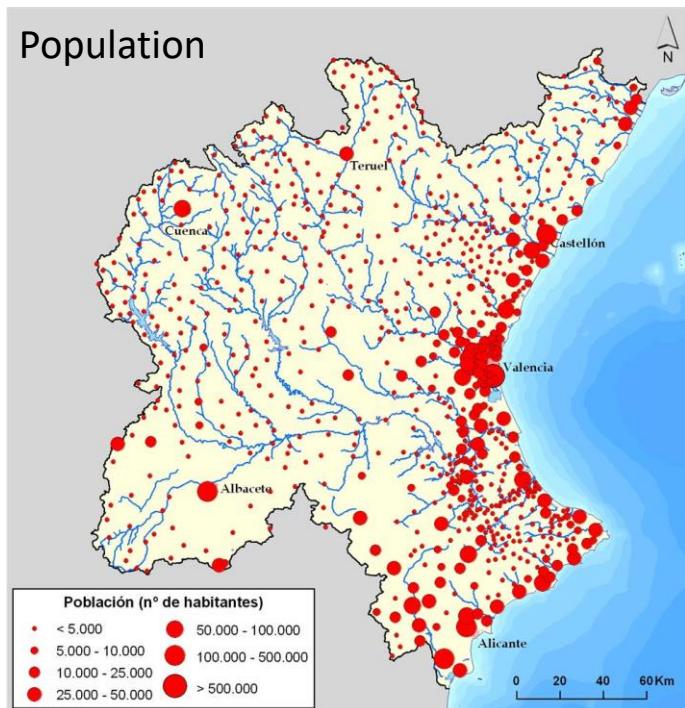

Water resources systems

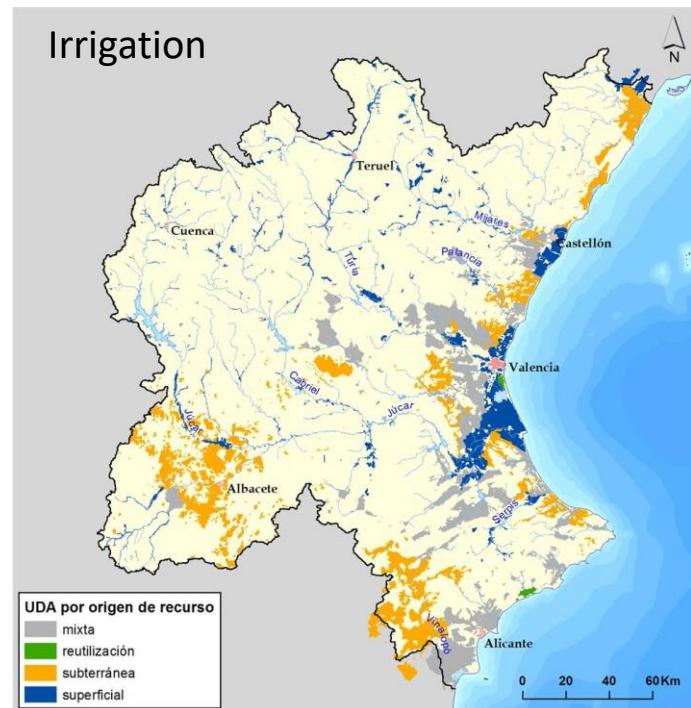

Surface (km ²)	42.735
Permanent population (2012)	5.178.000
Total equivalent population (2012)	5.697.000
Irrigated surface (ha)	390.000
Total inflow (hm ³ /year)	3.800
Total water demand 2012 (hm ³ /year)	3.240

Legal Framework for drought management in Spain

Drought management as emergency situation

- Spain has suffered important drought periods with severe impacts on water resources and water uses.
- Traditionally, droughts have been considered as an emergency situation to be restored with extraordinary water resources and measures.

Policy bases for Drought Management Plans

Law 10/2001, July 5, of the National Hydrological Plan, establishes the bases for the drought planned management:

- The **Ministry of Environment** will establish a **global hydrologic indicator system** to foresee drought situations and to serve as general reference for the formal declaration of droughts.
- **River Basin Organisations** will develop **Drought Management Plans (DMP)**.
- Public Administration in charge of public water supply for population greater than 20.000 inhabitants will develop an **Emergency Plan for Drought Situations**.

Drought Management Plans

Objective: minimise environmental, social and economic impacts of drought situations

Entities in charge: River Basin Organisations

Contents: includes diagnosis of situation, hydrological indicator system, programme of measures and management and follow-up system.

Approval: Ministerial Order in 2007 (*now under revision*)

Pastor anuncia que «habrá que esperar tres o cuatro días para que se regularice el servicio»
Aumentan la explotación de los pozos para garantizar el suministro de agua en Xàbia
Levante - EL MERCANTIL VALENCIANO - 35
Jaume Benaloy es el primer cura que se ordena en Benidorm en 30 años
ALICIA MASEGOSA
BENIDORM
Jaume Benaloy Marco nació en la época del despegue del inicio de la movida y de las noches sin fin, y todo ello elevado a la enésima potencia, porque además lo hizo en Benidorm, cuando la ciudad gozaba de su máximo esplendor turístico y era sede de acogida de todo aquél deseoso de dar rienda suelta a su recién estrenada libertad.
Hijo de madre murciana y padre benidormense, Jaume creció en el seno de una familia que se denominaba a sí misma «católica, pero a la carta». Nada impidió que sintiera una vocación religiosa con tan sólo 17 años y, después de obtener unas excelentes notas en la selectividad, decidió cambiar sus todavía no iniciados estudios de Económicas y Derecho por los de Teología. Ahora, con tan sólo 24 años se ha convertido en el primer sacerdote natural de Benidorm que ha sido ordenado desde hace más de tres décadas.
Hace tan sólo unos días, el joven cantó su primera misa en la ciudad que le vio nacer, y poco después lo hizo en la Parroquia de la Inmaculada de Alicante, donde actualmente oficia.

En Xàbia la población debe acudir a los depósitos para llenar las garrafas de agua potable. E. W.

se ha impuesto la tarea de mejorar la calidad del agua. De hecho, Sapena apuntó ayer la posibilidad de que en los próximos días entre en funcionamiento una planta desaladora móvil. El concejal señaló que ya estaban muy avanzadas las gestiones con la conselleria de Obras Públicas para instalar esa estación desaladora, que reducirá el elevado índice de cloruros que, en la actualidad, tiene el agua que suministra Amjasa.

Por otra parte, el concejal de Aguas del Ayuntamiento de Dénia, Pedro Pastor, reconoció ayer, en referencia a la situación de no potabilidad del agua

en la capital de la comarca, que «todo sigue exactamente igual». En este sentido, Pastor indicó que todavía «habrá que esperar tres o cuatro días más» para que sea posible la regularización del servicio de suministro de agua potable.

Agua embotellada

Los establecimientos distribuidores de agua mineral en Dénia han experimentado, durante los últimos días, un aumento considerable en las ventas de este producto, como consecuencia de la falta de suministro de agua potable en toda la población.

Water shortage in Javea during the drought period in the 90's.

Main contents of the Jucar Drought Management Plan

Basic elements of the Special Drought Plan

- Drought characterisation and diagnose
- Indicator system in situations of prolonged drought and occasional water scarcity
- Measures and actions to develop during the different phases of drought and water scarcity
- Drought follow-up and post-drought reports. Assessment of socioeconomic and environmental impacts
- Reference framework for supply emergency plans

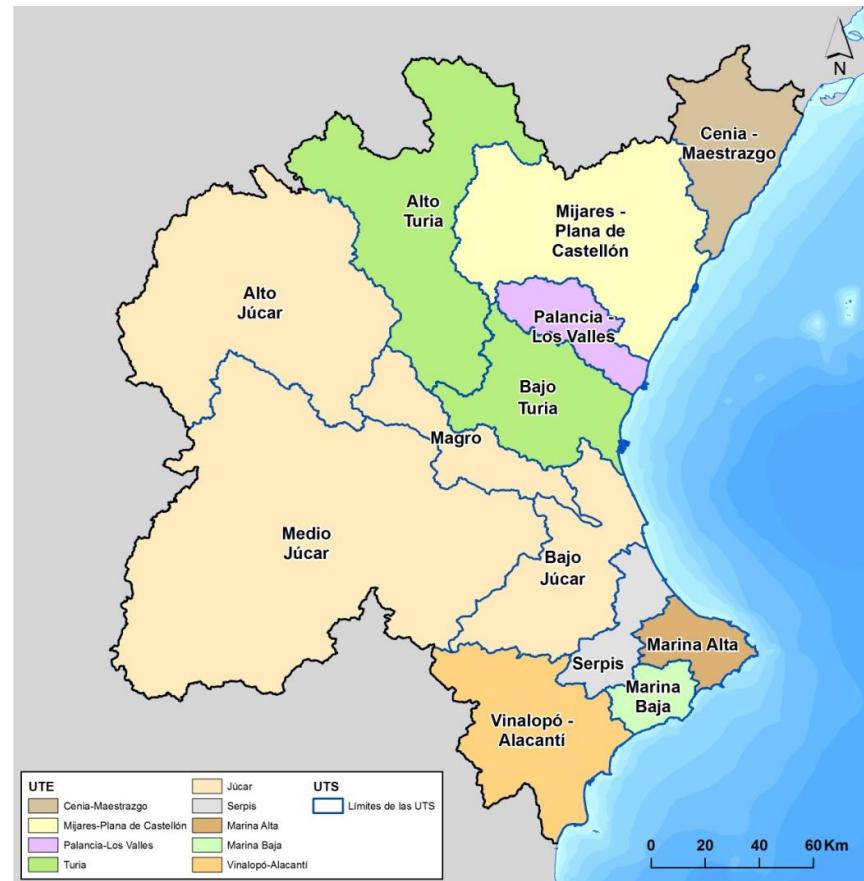

Indicators

Indicator system

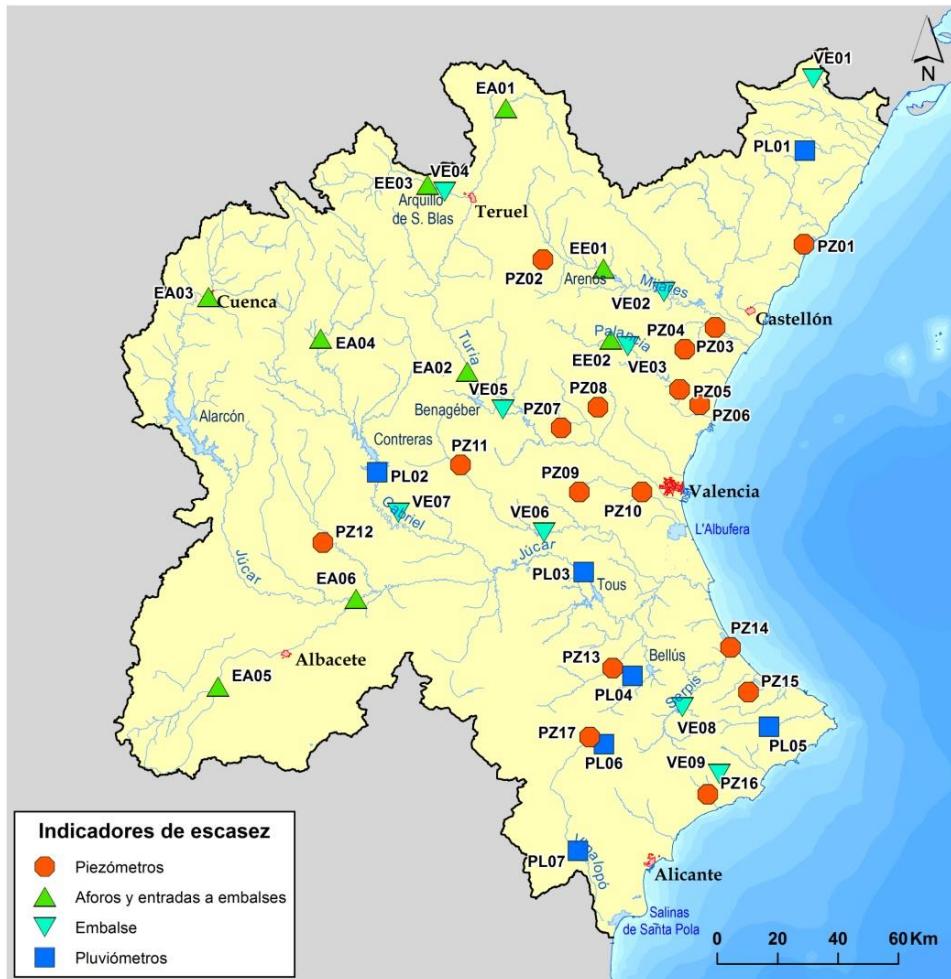

Double system: indicators of prolonged drought and scarcity indicators

Indicators for prolonged drought: identify persistent and intense situations of decreased rainfall, reflecting contributions in natural regime (SPI12)

Indicators for scarcity: identify situations of difficulty to meet demands due to occasional shortage.

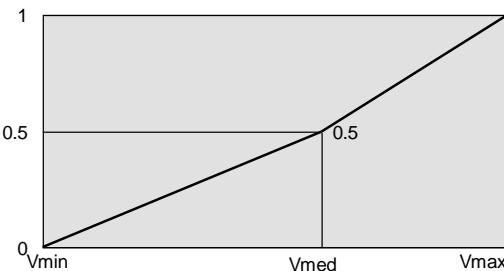

Water Scarcity Indicator System

Scarcity indicators: Based on rainfall data, piezometry, gauging and inflow to reservoirs and dammed volume

$$- Si \ V_i \geq V_{med} \Rightarrow I_e = \frac{1}{2} \left[1 + \frac{V_i - V_{med}}{V_{max} - V_{med}} \right]$$

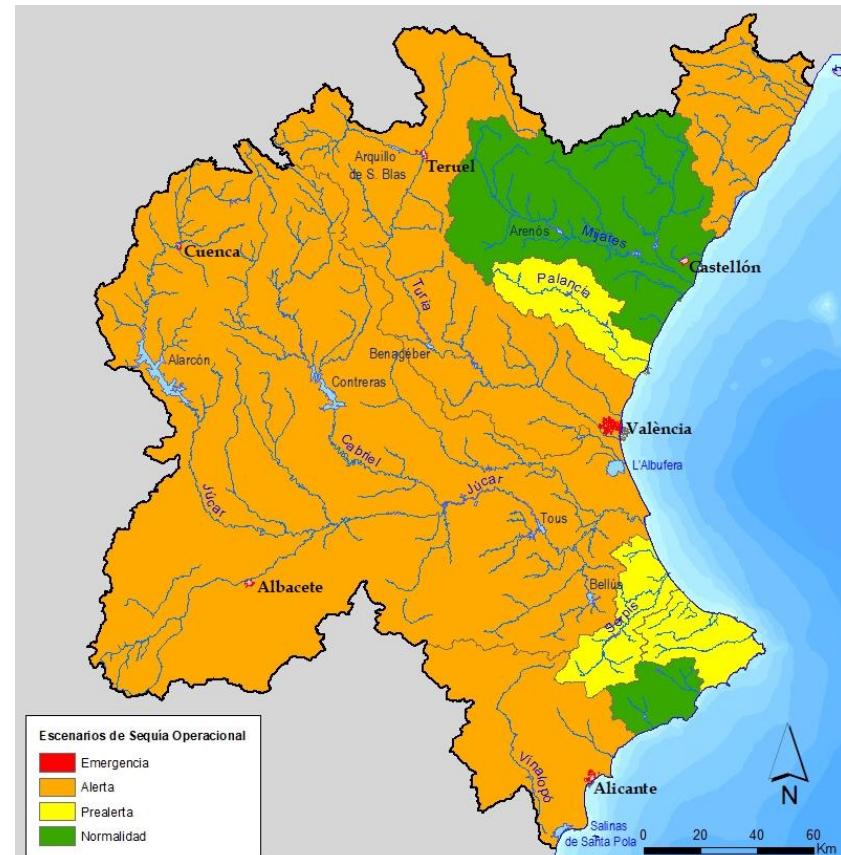

$$- Si \ V_i < V_{med} \Rightarrow I_e = \frac{V_i - V_{min}}{2(V_{med} - V_{min})}$$

Measures in the Drought Plan

Programme of Measures of the SPD

- The objective of the Special Drought Plan is to minimise the economic, environmental and social impacts of droughts.
- To this end, the SDP, in addition to making a spatial and temporal identification of droughts and water scarcity, programmes actions and measures that lead to mitigating their impacts.
- The SPD differentiates between:
 - Actions to implement in a prolonged drought scenario
 - Measures to apply in the occasional water scarcity scenarios (general and specific)

Type of measures in water scarcity

		Scarcity scenarios		
Status situation	No scarcity	Moderate scarcity	Severe scarcity	Serious scarcity
Scarcity scenarios	Normal	Prealert	Alert	Emergency
Type of actions and measures activated	General hydrological planning and monitoring	Awareness, savings and monitoring	Management measures (demand and supply), and control and monitoring (Article 55 of the MTWA)	Intensification of measures considered on alert and possible adoption of exceptional measures (Article 58 of the MTWA)

Data sheets with specific measures for scarcity per UTE

The SDP includes data sheets with specific measures to deal with scarcity situations in each of the territorial units.

UTE 2 Mijares-Plana de Castellón		
Status	Examples of specific measures to adopt	Competent Authority
Prealert	Activate emergency plans for the supply systems of Almassora, Burriana, Castelló de la Plana, Vall d'Uixó, Onda, Vila-real and Consortium of Aguas de la Plana as well as those systems that in the future reach 20,000 equivalent inhabitants	Relevant Municipalities
	Analysis of the possibilities of using new resources contributed by reuse from the WWTP of Almenara, Almassora, Borriana, Xilxes, Llosa, Moncofa, Vall d'Uixó and Castelló de la Plana.	CHJ y GV
	...	CHJ y GV
Alert	Materialisation of the possibilities of taking advantage of new resources contributed by desalination from the IDAM of Oropesa and Moncofa	CHJ
	Restriction of up to 100% of the surface supply to the mixed irrigations of the Mijares, with respect to its surface consolidated demand, taking into account the application of the Bases Agreement for the Regulation of the Mijares River.	CHJ
	Reinforcement of surveillance actions for the conservation and protection of the resource and aquatic ecosystems considering the protection of wetlands, the protection of fluvial species and the impact of other measures on the natural environment, with special attention to the Marjal d'Almenara.	CHJ y GV
Emergency	...	
	Intensification of the possibilities of using new resources contributed by desalination from the IDAM of Oropesa and Moncofa.	CHJ
	Start of the restrictions to protect the available surface resources: between 15 and 25% of the supply to the traditional irrigations of the Mijares with respect to its consolidated demand.	CHJ
	Restriction of up to 100% of the surface supply to the mixed irrigations of the Mijares, with respect to its surface consolidated demand, taking into account the application of the Bases Agreement for the Regulation of the Mijares River.	CHJ
	Start of saving measures to protect the underground resources available in bodies of groundwater in poor quantitative state, especially in Plana de Castelló: reduction of up to 15%.	CHJ y users
	...	

Examples of specific measures: restrictions

Proposed reduction percentage to users from UTE 4 Turia

Demand Unit	Source	Porcentajes de reducción			
		Normal	Prealert	Alert	Emergency
Supplies	Surface	0%	0%	0%	0%
Real Acequia de Moncada	Surface	0%	10-20%	25-35%	35-45%
	Total		10-20%	15-25%	20-30%
Vega de Valencia	Surface	0%	10-20%	35-45%	45-55%
	Total		10-20%	15-25%	20-30%
Pueblos Castillo	Surface	0%	10-20%	15-25%	25-35%
	Total		10-20%	15-25%	20-30%
Irrigation of the main Canal in Camp de Túria	Surface	0%	10-20%	30-40%	45-55%
	Total		5-15%	10-20%	15-25%

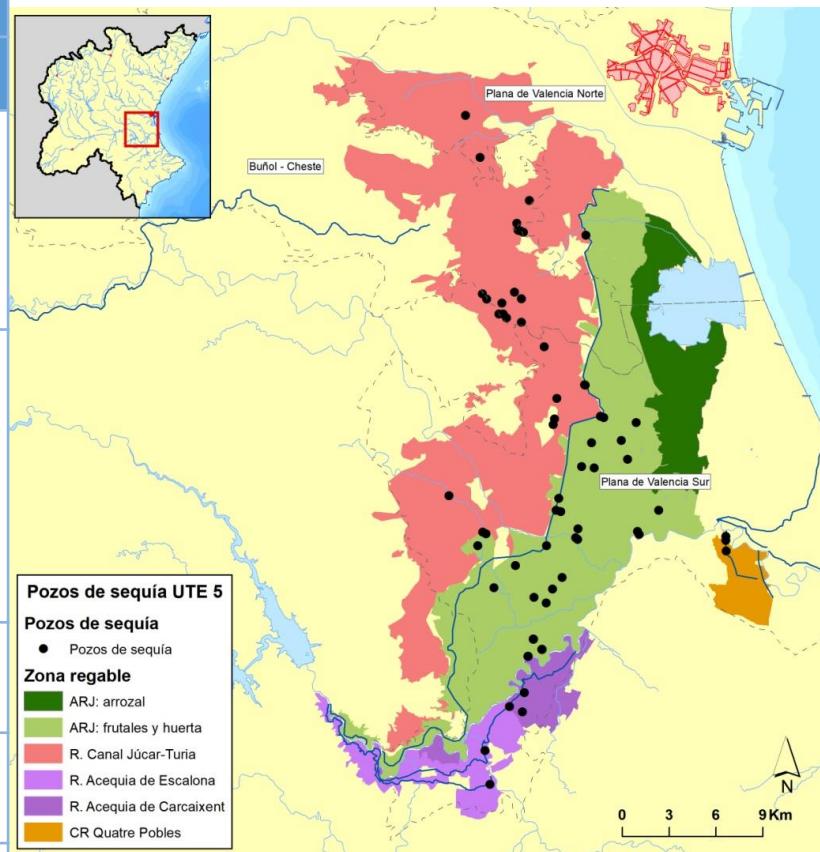

Examples of specific measures: restrictions on underground masses in poor quantitative state

- Initiation of saving measures to protect the resources available in groundwater bodies with poor quantitative status: general reduction up to 15% of abstractions for irrigation, depending on the territorial unit and the scenario.
- These restrictions will apply, especially in those groundwater bodies with significant abstractions for urban use or with special relation to surface water or protected natural spaces.
- This percentage of average reduction of 15% can be distributed spatially depending on the affection of groundwater abstractions to surface water or protected spaces.

Examples of specific measures: drought wells

Abstraction volumes through drought Wells according to scenario in UTE 5 Júcar

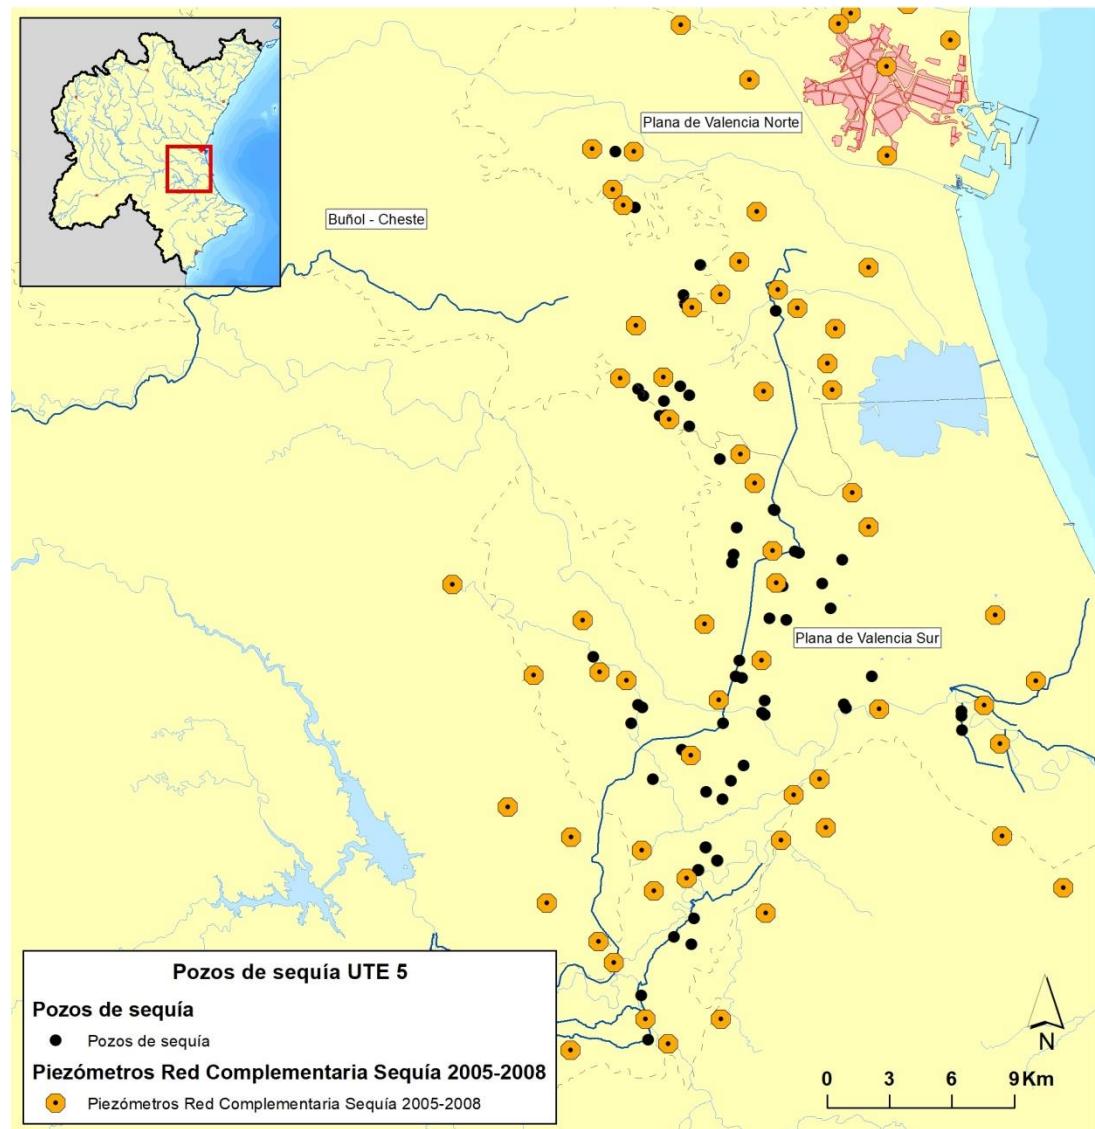

Irrigable area	Code	Name	Nº abstractions	Abstraction volumen according to scenario (hm ³ /year)			
				Total capacity	Prealert	Alert	Emergency
Acequia Real del Júcar	080.141	Plana de Valencia Norte	1	0,4	12,1	24,2	24,2
	080.142	Plana de Valencia Sur	37	23,8			
Canal Júcar-Turia	080.140	Buñol - Cheste	13	5,1	3,4	6,8	12,0
	080.141	Plana de Valencia Norte	5	2,3			
	080.142	Plana de Valencia Sur	9	4,6			
Real Acequia Escalona	080.142	Plana de Valencia Sur	2	2,0	1,0	2,0	2,0
Real Acequia Carcaixent	080.142	Plana de Valencia Sur	3	2,6	1,3	2,6	2,6
Acequia de Quatre Pobles	080.142	Plana de Valencia Sur	3	2,0	1,0	2,0	2,0
Total			73	42,8	18,8	37,6	42,8

Examples of specific measures: drought Wells monitoring

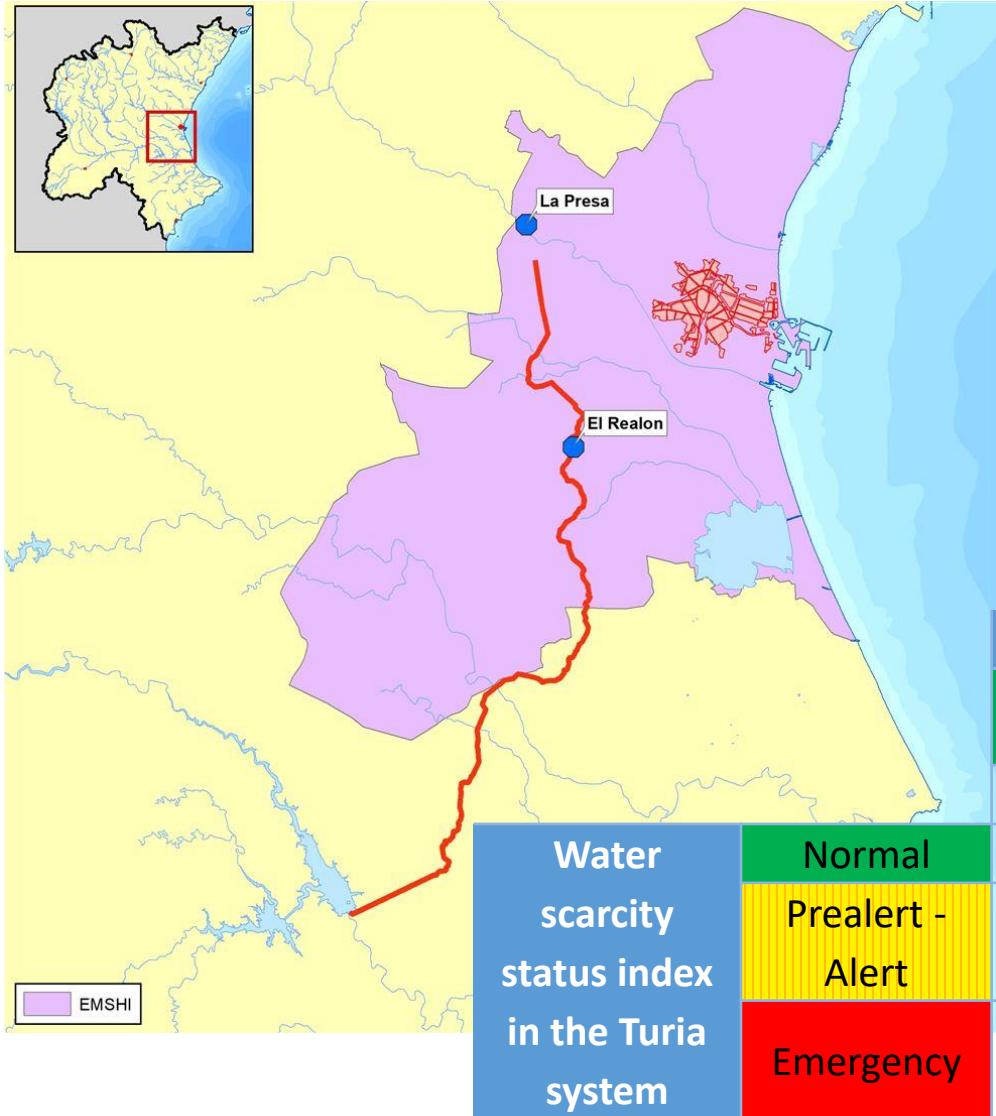

Control of abstractions in drought well extractions in UTE Júcar

- Improvement of the piezometric control in the areas of influence of the drought wells, especially in l'Albufera of València.

Examples of specific measures: changes in source

Percentage of distribution of the supply from the Turia and Júcar to the Metropolitan Area of Valencia.

	Normal	Prealert - Alert	Emergency
Turia	20%	35%	50%
Júcar	80%	65%	50%

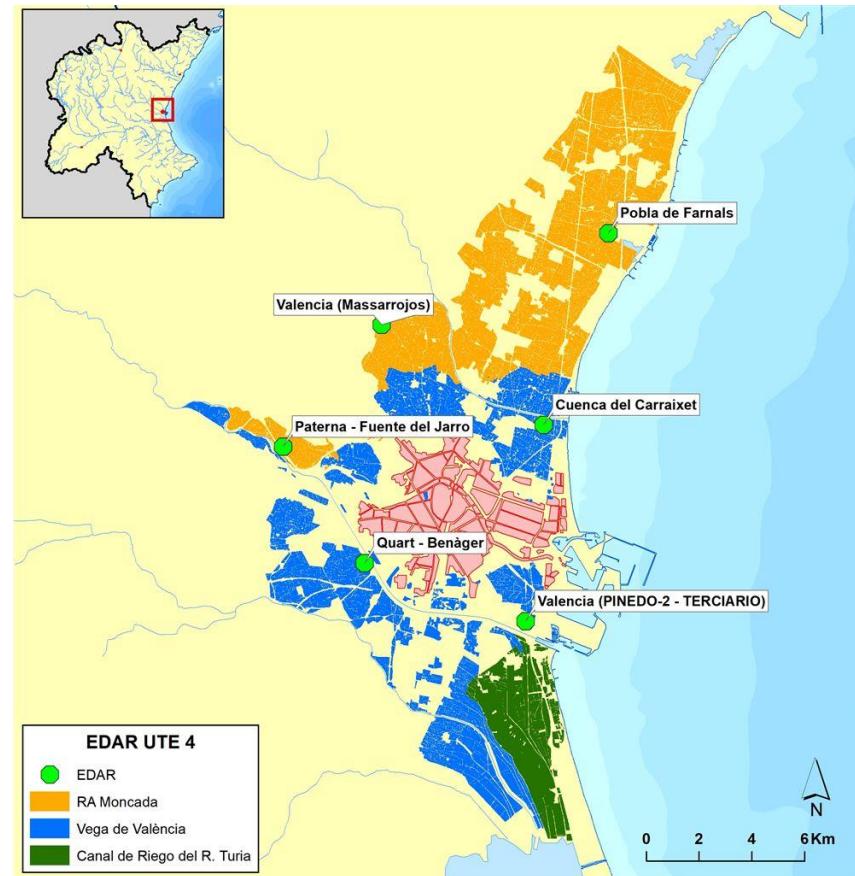

Water scarcity status index in the Turia system	Normal	Prealert - Alert	Emergency
Turia	20%	35%	50%
Júcar	80%	65%	50%

Water scarcity status index in the Júcar system	Normal	Prealert - Alert	Emergency
Turia	20%	35%	50%
Júcar	80%	65%	50%

Examples of specific measures: non-conventional resources

Intensification of the possibilities of using new resources contributed by reuse from the WWTP of the system, especially of the Carraixet Basin, Paterna-Fuente del Jarro, Pinedo, Pobla de Farnals and Quart-Benàger.

- As established in the regulations, the River Basin Management Plan, in situations where the scarcity index reaches the pre-alert status, will encourage the use of these resources by the irrigation system according to their current licences.

Examples of specific measures: non-conventional resources

Volumes from desalination according to scenario in UTE 8 Marina Baja.

Examples of specific measures: environmental impact reduction

Specific environmental measures in the emergency scenario in UTE 5 Júcar

Status	Measures to adopt	Competent Authority
Emergency	Reinforcement of surveillance actions for the conservation and protection of resources and aquatic ecosystems considering the protection of wetlands and fluvial species and the impact of other measures on the natural environment with special attention to L'Albufera of València, the middle stretch of the Júcar as it passes through La Mancha plain and the final stretch of the river, downstream of the Tous dam, including the Massalavés spring.	CHJ, GV y JCCLM
	Application of specific monitoring programmes to record the environmental impacts associated with critical episodes, with special attention to L'Albufera of València, the middle section of the Júcar as it passes through La Mancha plain and the final section of the river, downstream of the Tous dam, including the Massalavés spring.	CHJ, GV y JCCLM

In order to safeguard environmental conditions, a minimum volume is set for exploitation purposes, and in all cases environmental management measures must be initiated as volumes close to the indicated value are reached.

Dam	Minimum volume (hm ³)
Alarcón	30
Bellús	6
Contreras	15
Forata	0,75
Tous	39

EMERGENCY PLANS FOR URBAN SUPPLIES WITH MORE THAN 20,000 INHABITANTS

Emergency plans for urban Supplies > 20.000 inhabitants

Article 27 of *Law 10/2001, of July 5, of the National Hydrological Plan*, dedicated to drought management, establishes the following in its section 3 :

"Public administrations responsible for urban supply systems that attend, **singularly or jointly, a population equal to or greater than 20,000 inhabitants** must have an **Emergency Plan in the event of drought**. Said Plans, which will be informed by the basin organisation or corresponding water administration, **must take into account the rules and measures provided for in the special plans** referred to in section 2, and must be operational within a maximum period of four years. "

In the JRBD, **72 supply systems** have been identified: 65 municipalities with more than 20,000 inhabitants and 7 associations or consortiums that supply groups of municipalities with more than 20,000 inhabitants.

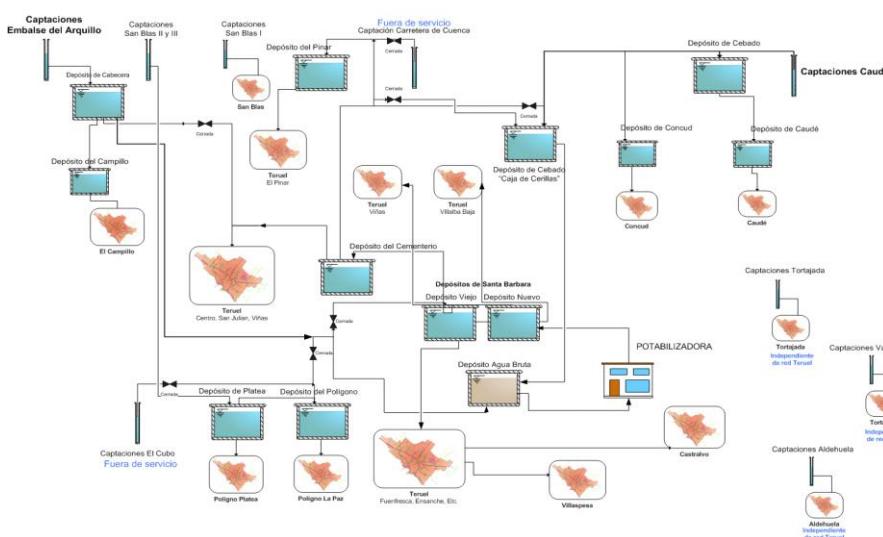

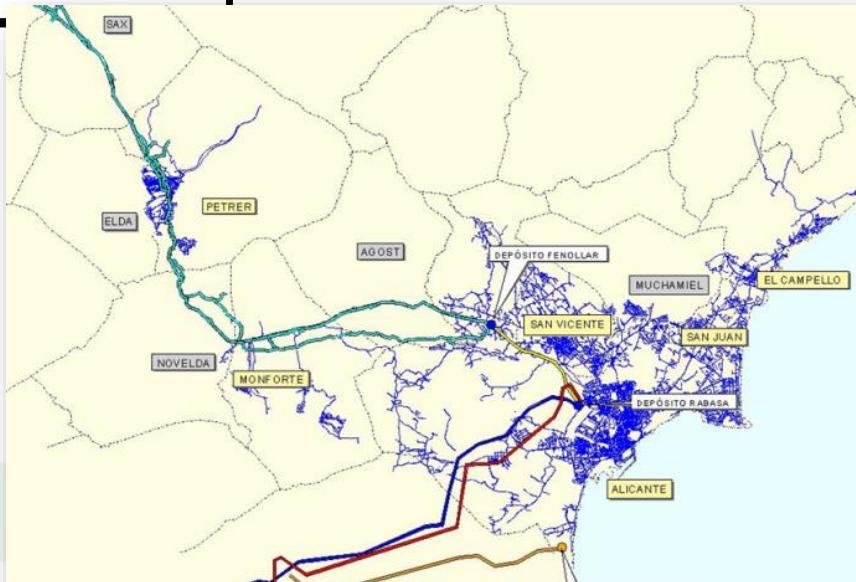

Despite it is not obligatory, it is recommended that municipalities with less than 20,000 inhabitants write EPs, as it is a useful tool to anticipate problems.

Basic contents of EPs according to the Instruction

The SDP establishes that the **basic contents of the Emergency Plans (EPs)** must include the following aspects:

- a) Regulatory and institutional framework applicable to the supply system.
- b) Identification and description of the set of elements and infrastructures that supply the urban nucleus.
- c) Definition and description of available resources.
- d) Definition and description of demands.
- e) Rules of operation and supply areas of the system.
- f) Identification and analysis of the greatest risk areas and circumstances.

Some examples

Basic contents of EPs according to the Instruction

- g) Definition and description of short-term EP scenarios.
- h) Analysis of the coherence between EP and SDP:
 - I. Correspondence of the indicators, thresholds and shortage scenarios adopted in the Emergency Plan with those defined in the Special Drought Plan.
 - II. Coherence of the measures proposed in the Emergency Plan with those in the Special Drought Plan. In particular, the Emergency Plan will define both the reductions with respect to the total demand in Normal scenarios, and the alternative resources considered, for the different occasional scarcity scenarios.
 - III. Consistency with the environmental conditions of the River Basin Management Plan of the district and the Special Drought Plan, especially those referring to scarcity scenarios. Establishment of actions and necessary measures to mitigate the effects of scarcity on the environment, ensuring - within the framework of its obligations and competences - compliance with these environmental conditions.
- i) *Economic analysis of cost of measures and impacts*

Main measures

- Act during normal status:
 - Avoid leaks in supply networks
 - Diagnose of supply weaknesses
- During drought:

DEMAND MANAGEMENT	SUPPLY MANAGEMENT
-Customer management: fraud search,...	-Put into operation emergency wells
-Rationalization of uses: information on invoices, web, customer service,...	-Negotiation of temporary rights or exchanges of rights
-Information campaigns	-Increase use of reuse water
-School Campaigns	-Increase use of desalinated water
-Adaptation of tariffs by sections of consumption	-Increase pumping rate
-Restrictions on secondary uses	-Increased efficiency, reduce pressure,...

Awareness campaigns

Thank you for your attention!
